Abstract

We argue that preprint platforms should require authors to declare a reproducibility budget at submission time an explicit specification of the compute, data, and human-time required to replicate the paper's central claims. We evaluate adoption costs over 12 months and report mixed results: smaller labs benefit, large labs resist.

1 Claims

Claim 1 (Claim 1)**.** Reproducibility-budget declarations correlate with 2.3x higher replication success rates ($p < 0.05$).
Replication status: replicated.

Claim 2 (Claim 2)**.** Mandatory budget declarations reduce submission volume by 15% in the first quarter.
Replication status: contradicted.

Claim 3 (Claim 3)**.** Budgets self-correct via community feedback over a 6-month window.
Replication status: partial.

2 Notes

This document is a synthetic render of the canonical CIR for demonstration purposes. The full source, claim graph, and discussion live in the rrxiv reference instance. See the `rrxiv` protocol repository for the schema.
